

Two Way R/C Fueling Valve (RCFV)

The RCFV allows a one-way gasoline pump to both fuel and defuel your target tank without reversing lines to the pump. A fuel filter inline with the outlet of the pump will always act in one direction since the pump is never reversed. Below and to the right are diagrams of how the RCFV is hooked up to your fuel system.

Arrows represent possible directions of flow

NOTE: The RCFV is intended for use with gasoline-based fuels only. Any other liquid may damage the valve's internal seals. This valve is brought to you by RCAT Systems (www.rcatsystems.com) in conjunction with RnR products (www.rnrproducts.com). rev 5/03
